WHAT IT IS

Laya is a multilingual, non-autoregressive 'System 1' decision model from ConvAIInnovations that provides mathematically calibrated probabilities for text classification, not generative text.

GET IT RUNNING

```
pip install laya
Copy the quickstart code from the description.
Define your input 'state' and 'questions' with types like 'choice',
'score', or 'noul'.
Run the classification.
```

MAKE THESE 3 THINGS

- Automate customer support by routing emails to departments or detecting churn risk.
- Perform content moderation by classifying text for hate speech or spam with calibrated probabilities.
- Apply guardrails to AI outputs by assessing text for specific criteria.

SKIP IT IF

If your domain requires extremely high accuracy on niche decisions that differ greatly from general knowledge, as it may require fine-tuning.
